In order to reach a conclusion about the success of regeneration in Birmingham data must be collected. There are two types of data, ? and ?

? data is that collected by us in our location, whereas ? data is when ……………………

Almost all of our primary data is q, because although it is numerical, it is mostly based upon ?

The main advantage of primary data is that …………………………. One disadvantage is that the sample size is ? because ……..

Secondary data has the advantage of ………………. however we cannot be sure that ……….

To ensure that our data collection was a fair test we ………………….

The types of survey we carried out were: [list them by name here]

To be entirely useful and make best use of time, we needed to ensure that the data being collected, would help us prove how successful regeneration has been.

Data Collection Survey Name	How it helps prove if regeneration is successful ….?
EQS	Tells us about the quality of the environment of the regenerated area. The higher the scores the more likely it is that the regeneration has been successful. The maximum possible score is ??

- Field sketches
- Photographs
- Sustainability score card.
- Environmental Quality survey
- Questionnaire
- Quality of Life
